

# SAGE: Intrusion Alert-driven Attack Graph Extractor

**Azqa Nadeem**<sup>\*</sup>, Sicco Verwer<sup>\*</sup>, Shanchieh Jay Yang<sup>^</sup>

*<sup>\*</sup>Delft University of Technology, The Netherlands*

*<sup>^</sup>Rochester Institute of Technology, USA*

IEEE Symposium on Visualization for Cyber Security (VizSec)

# Background

- Attacker strategy identification requires manual effort
  - How?
  - Multiple attackers?
  - Strategic similarity?
- Answers via cybersec data + expert input

# Background

- Security analysts receive > 1M intrusion alerts/day\*

```

# Background

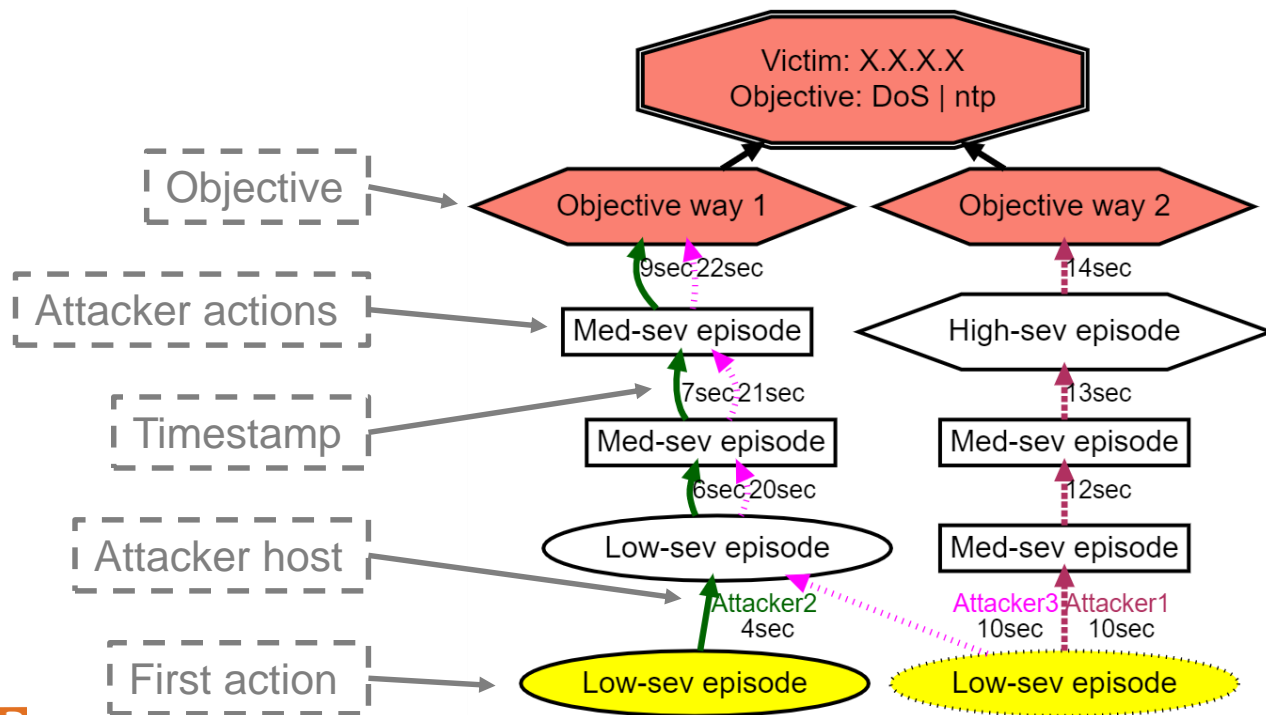

- Automate attacker strategy identification
- via *Alert-driven* Attack Graphs

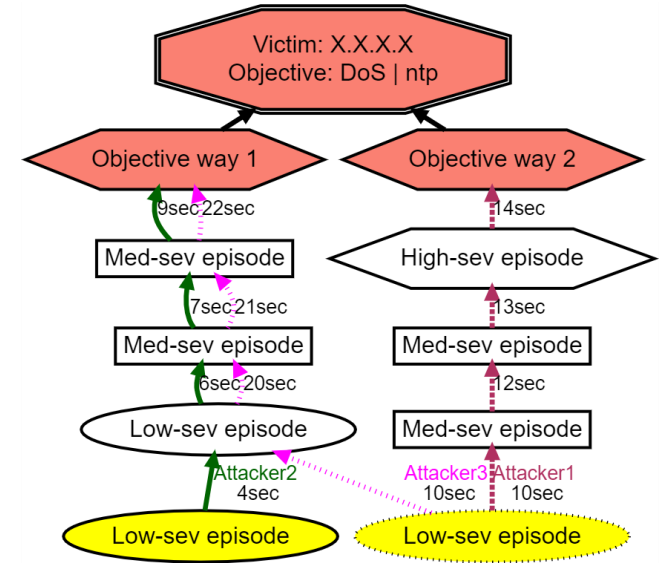

# Traditional approaches

- Topological Vulnerability Analysis (TVA)
  - Network topology + Vulnerability reports
  - Mu1Val by Ou *et al.* (USENIX '05)
- Alert-driven attack scenario modelling
  - Causal analysis by Ning *et al.* (CCS '02)
  - Visual summary by De Alvarenga *et al.* (Computers & Security '18)
  - Strategy discovery by Moskal *et al.* (ISI '18)

# Anatomy of an Alert-driven Attack Graph

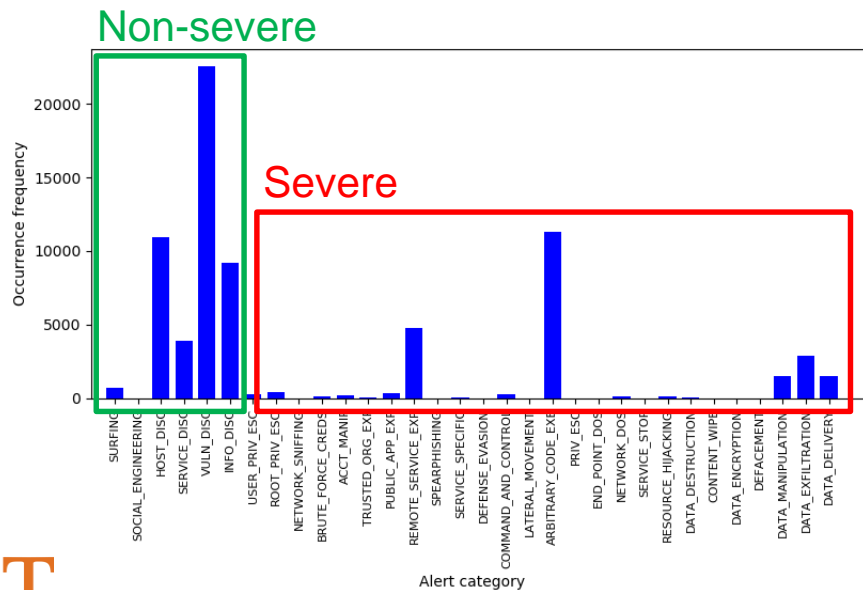

# Key design challenges

# Key design challenges

## 1. Alert-type imbalance

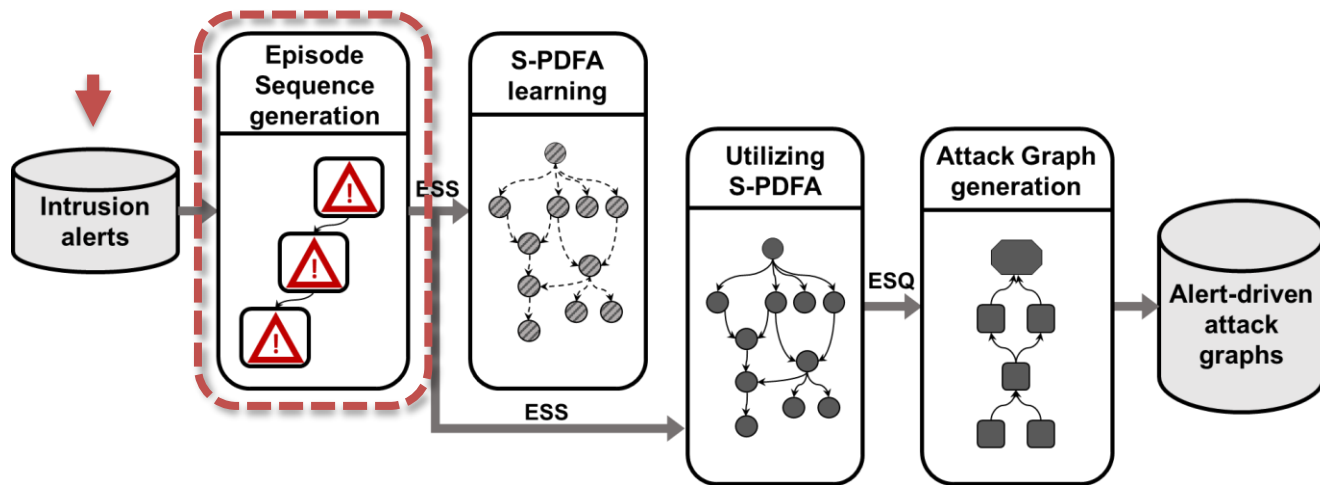

# Key design challenges

1. Alert-type imbalance
2. Context modelling

# SAGE: IntruSion alert-driven Attack Graph Extractor

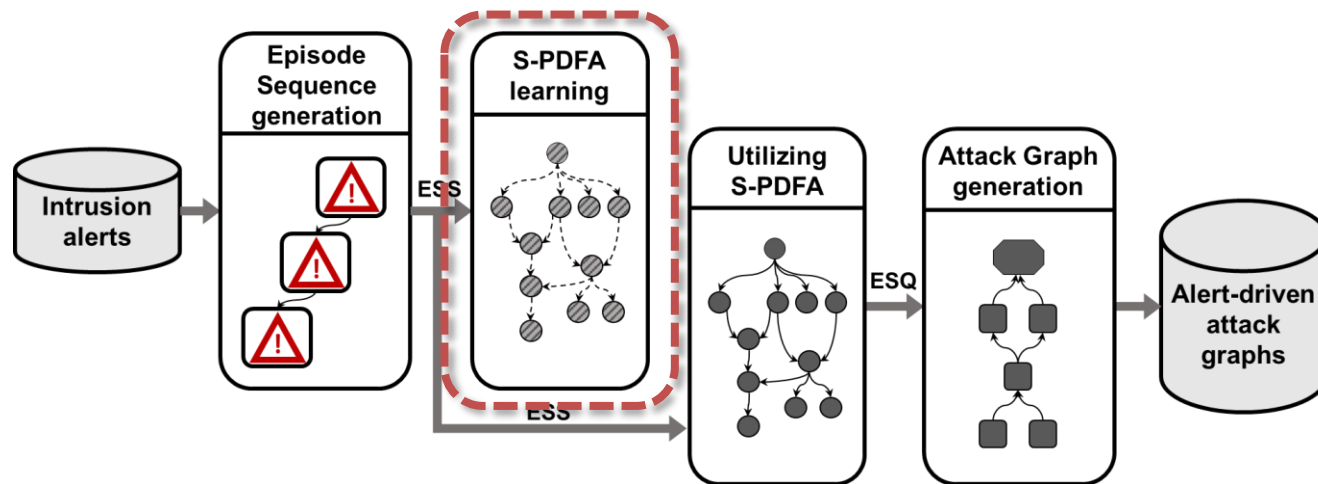

# Alert → Episode sequences

```
{
  '_sourcetype': 'suricata:alert',
  'alert': {
    'category': 'Attempted Information Leak',
    'severity': 2,
    'signature': 'ET POLICY Python-urllib\\/'
                'Suspicious User Agent',
    'dest_ip': '169.254.169.254',
    'dest_port': 80,
    'src_ip': '10.0.0.20',
    'src_port': 56952,
    'timestamp': '2018-11-03T13:51:58.205548+0000'}}}
```

# SAGE: Intrusion alert-driven Attack Graph Extractor

# Suffix-based PDFA

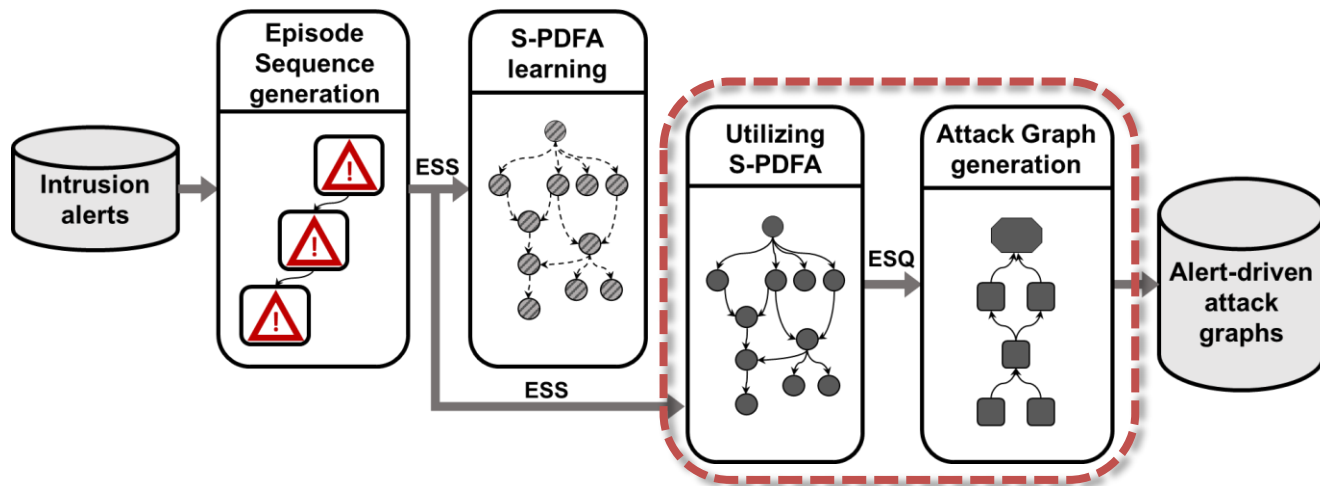

- Summarizes attack paths
- Brings infrequent episodes to the top
  - Red → Severe | Blue → Medium severity
- States → milestones with context
- Good model quality compared to alternatives
  - via Perplexity

End →

Start →

# SAGE: IntruSion alert-driven Attack Graph Extractor

# Adding context & AG formation

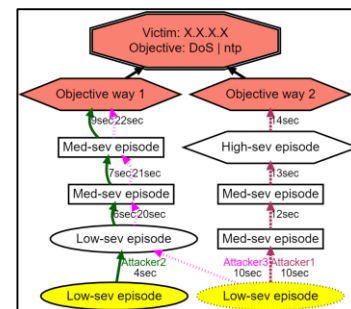

Episode sequences

State sequences

Vertex: Group of alerts  
Edge: Temporal order

*On a per-victim,  
per-objective basis*

# Experimental dataset

- Suricata alerts from Collegiate Penetration Testing Competition<sup>1</sup>
  - 6 multi-attacker teams
  - 1 fictitious network
  - 330,270 alerts
- Moskal's Action-Intent framework<sup>2</sup>
  - Alert signature → Attack stage
  - Based on MITRE ATT&CK

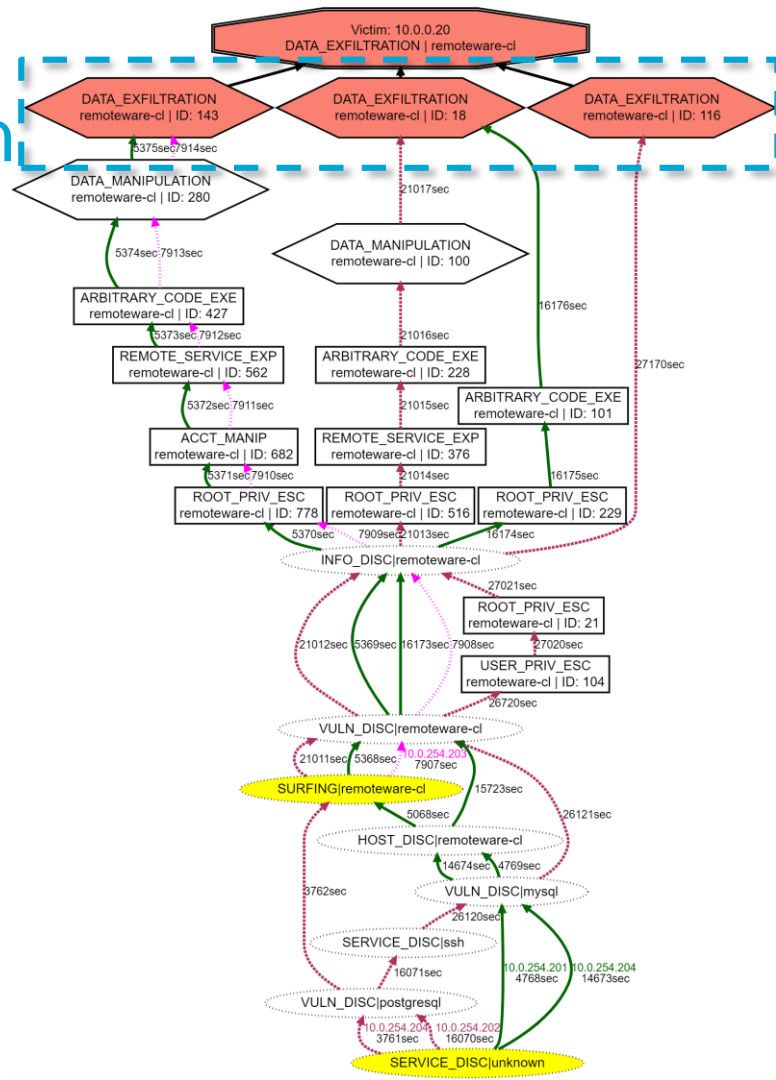

# [1] Alert triaging

- 330,270 alerts → 93 alert-driven AGs
- ~500 alerts in < 25 vertices
- Average simplicity = 0.81

	# alerts (raw)	# alerts (filtered)	#episodes	#ES/ #ESQ	#ESS	#AGs
<b>T1</b>	81373	26651	655	103	108	53
<b>T2</b>	42474	4922	609	86	92	7
<b>T5</b>	52550	11918	622	69	74	51
<b>T7</b>	47101	8517	576	63	73	23
<b>T8</b>	55170	9037	439	67	79	33
<b>T9</b>	51602	10081	1042	69	110	30

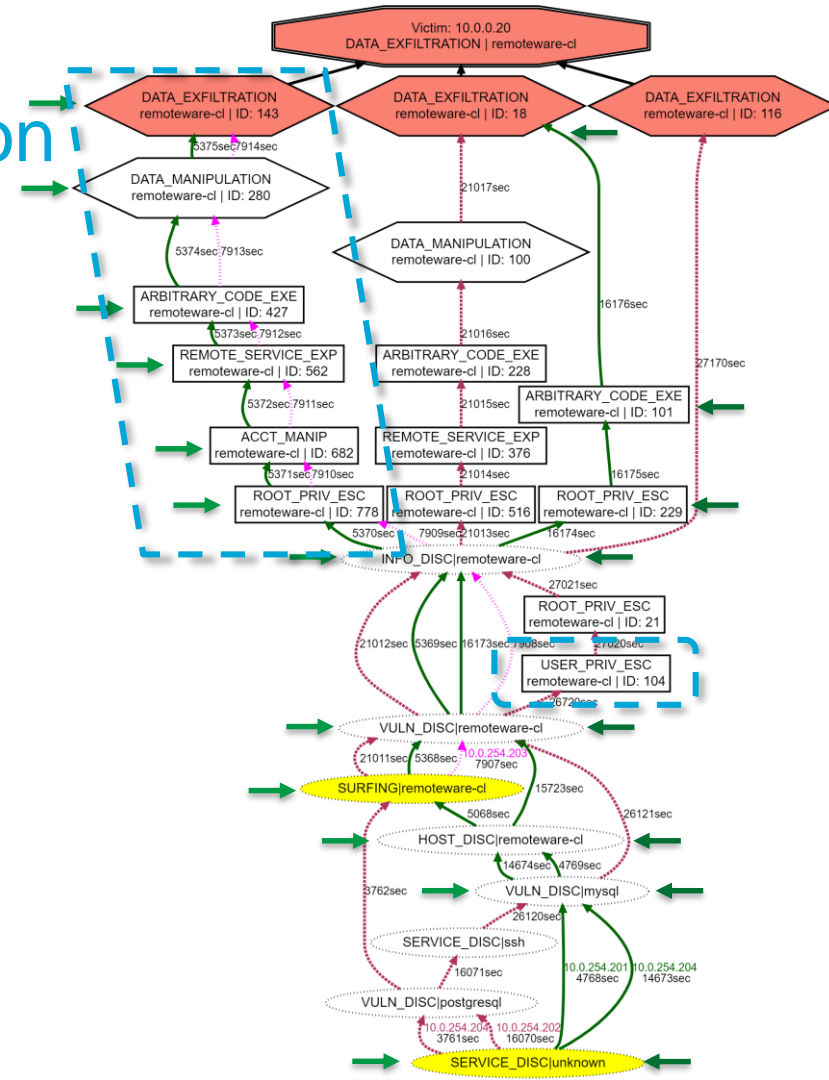

## [2] Attacker strategy visualization

- Shows how the attack transpired
- 3 teams, 5 attempts
- 3 ways to reach objective
  - Discovered by S-PDFA

### [3] Attacker strategy comparison

- T5 and T8 share a common strategy
- Only T1 does user privilege escalation
- Some paths are shorter than others
- Attackers follow shorter paths to re-exploit an objective in 84.5% cases

# Future research directions

- Attack graph prioritization
- Advanced comparative visual analysis for strategy comparison
- Applications
  - Improving IDS signatures
  - Suggesting additional sources for evidence collection

# Take aways

- SAGE uses sequence learning to extract attacker strategies
  - Builds attack graphs from intrusion alerts without expert input
- The S-PDFA is critical for
  - Accentuating infrequent severe actions,
  - Identifying contextually different actions
- Alert-driven attack graphs
  - Compress thousands of alerts in a few AGs
  - Provide insights into attacker strategies
  - Capture attackers' behavior dynamics

# Thank you!

# Questions?

- ▶ SAGE uses sequence learning to extract attacker strategies  
Builds attack graphs from intrusion alerts without expert input
- ▶ The S-PDFA is critical for  
Accentuating infrequent severe actions,  
Identifying contextually different actions
- ▶ Alert-driven attack graphs  
Compress thousands of alerts in a few AGs  
Provide insights into attacker strategies  
Capture attackers' behavior dynamics

**SAGE is open-source!**

# Extra: S-PDFA specifics

- $A = \langle Q, \Sigma, \Delta, P, q_0 \rangle \rightarrow$  model structure
- $Q \rightarrow$  finite set of states
- $\Sigma \rightarrow$  finite alphabet of symbols
- $\Delta \rightarrow$  finite set of transitions
- $q_0 \in Q \rightarrow$  final state (suffix model)
- $\langle q, q', a \rangle \in \Delta \rightarrow$  a transition, where  $q, q' \in Q$  and  $a \in \Sigma$
- $\{P : \Delta \rightarrow [0,1]\} \rightarrow$  transition probability function
- $P(s) = \prod_{0 \leq i < n} P(\langle q_i, q_{i+1}, a_{n-i} \rangle) \rightarrow$  sequence probability
- $\sum_{q,a} P(\langle q, q', a \rangle) = 1$

# Extra: S-PDFA specifics

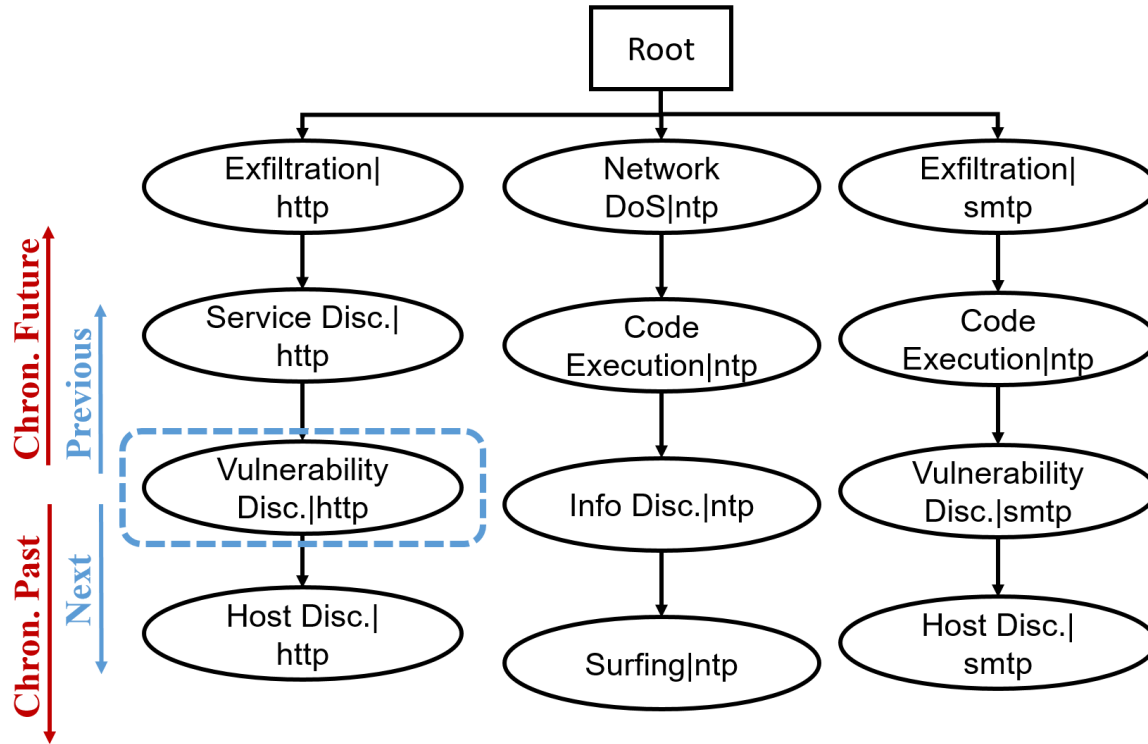

# Extra: S-PDFA evaluation

- $Perplexity(M) = 2^{-\frac{1}{N} \sum_{i=1}^N \log_2 P(x_i)}$
- $P(x_i) \rightarrow$  probability of trace
- $N \rightarrow$  Number of traces

	Suffix tree	Markov chain	SAGE S-PDFA
Training set	1265.4*	13659.6	2397.8
Holdout test set	13020.7	11617.8	9884.6*

# Extra: Suffix-tree specifics
